SafetySense
CALLS FOR HELP WHEN YOU CAN'T

ATTACHMENT 2 OF 5 · SCREENSHOTS

Three moments in one night out

Real screens from our working iOS 26 build in the iPhone 17 Pro simulator, not mock-ups. They follow one Night Out session from calm guarding to an alert and help on the way.

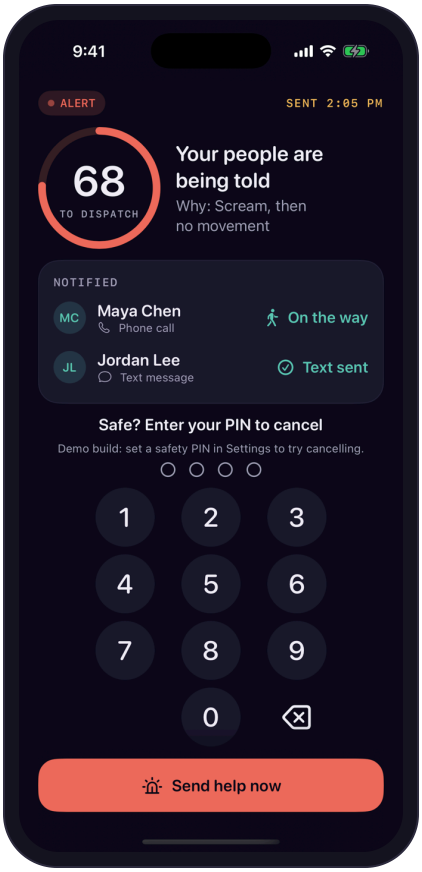

1 Guard active

LEVEL 0 · GUARDING

The user started a Night Out session. Sound, speech and motion are analysed **on the phone**. The next check-in, the sensors in use and a plain-language risk meter are always visible.

"Nothing is saved unless something seems wrong."

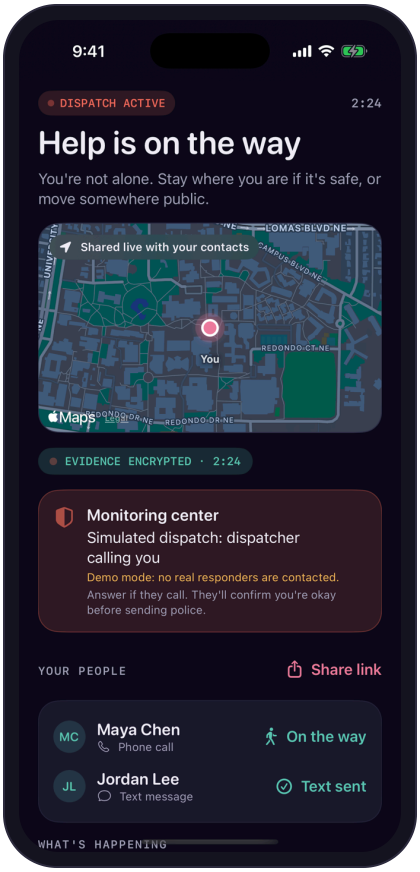

2 Alert countdown

LEVEL 2 · ALERT

A scream followed by no movement, with no answer to the check-in, raised an alert **without a tap**. Contacts got a call and a live link, and the screen says why. Dispatch starts in 90 s unless the user cancels with their PIN.

A duress PIN looks exactly like cancelling but silently sends help.

3 Help is on the way

LEVEL 3 · DISPATCH

Professional monitoring takes over. Contacts see the live location and respond ("Maya is on the way"), and evidence is recorded **encrypted on the device**.

In the demo, dispatch is clearly labelled "simulated". No real responders are sent.

GUARDING → CHECK-IN → ALERT CONTACTS → PROFESSIONAL DISPATCH
